

Graphing Functions

Suggested steps for sketching a curve given a function $y = f(x)$.

1. Find the Domain: Identify what values of x are allowed in the function. For any polynomial this will be all real numbers.

2. Find intercepts: To find the y -intercept, plug $x = 0$ into the function. This is usually easy to calculate. The y -intercept is at $(0, f(0))$. The x -intercepts are calculated by solving for the x 's where $f(x) = 0$. Sometimes this is hard to do, for example, $f(x) = 2x^3 - x^2 + x - 7$. If it's hard to find the x -intercepts then don't do it.

3. Find the asymptotes and determine end behavior: If $\lim_{x \rightarrow \infty} f(x)$ or $\lim_{x \rightarrow -\infty} f(x)$ equals L , then there is a horizontal asymptote at $y = L$. If $\lim_{x \rightarrow M^\pm} f(x) = \pm\infty$, then there is a vertical asymptote at $x = M$.

4. Take $f'(x)$ and find where its positive ($f(x)$ is increasing) and negative ($f(x)$ is decreasing). Identify any local maxima/minima by noting where $f'(x)$ changes sign (+ to -, or - to +) when going across points in the domain of $f(x)$.

5. Calculate $f''(x)$ and find where its positive ($f(x)$ is concave up) and negative ($f(x)$ is concave down). Identify any inflection points by noting where $f''(x)$ changes sign when going across points in the domain of $f(x)$.

6. Sketch the graph.

Ex. Sketch $f(x) = \frac{2x^2}{x^2-1}$. Include the domain, intercepts, asymptotes, end behavior, where $f(x)$ is increasing/decreasing, local maxima/minima, where $f(x)$ is concave up/down, and any inflection points.

1. Domain: All real numbers except $x = \pm 1$.

2. Intercepts: $x = 0 \Rightarrow f(0) = \frac{2(0)^2}{(0)^2-1} = 0$, y -intercept is $(0,0)$.

$$y = 0 \Rightarrow \frac{2x^2}{x^2-1} = 0 \Rightarrow x = 0, \quad x\text{-intercept is } (0,0).$$

3. Asymptotes: Vertical asymptotes- $f(x) = \frac{2x^2}{x^2-1}$; $x = \pm 1$.

Horizontal asymptotes-

$$\lim_{x \rightarrow \pm\infty} \frac{2x^2}{x^2-1} = \lim_{x \rightarrow \pm\infty} \frac{x^2(2)}{x^2(1-\frac{1}{x^2})} = 2 \Rightarrow y = 2.$$

4. Sign of $f'(x)$: Find where $f'(x)$ is 0 or undefined.

$$f'(x) = \frac{(x^2-1)4x - 2x^2(2x)}{(x^2-1)^2} = \frac{-4x}{(x^2-1)^2} = 0 \Rightarrow x = 0.$$

$f'(x)$ is undefined at $x = \pm 1$.

Test the sign of $f'(x)$ on the intervals: $x < -1$, $-1 < x < 0$,

$0 < x < 1$, $1 < x$.

$$f'(-2) = \frac{-4(-2)}{((-2)^2-1)^2} = \frac{+}{+} = +$$

$$f'\left(-\frac{1}{2}\right) = \frac{-4\left(-\frac{1}{2}\right)}{\left(\left(-\frac{1}{2}\right)^2-1\right)^2} = \frac{+}{+} = +$$

$$f'\left(\frac{1}{2}\right) = \frac{-4\left(\frac{1}{2}\right)}{\left(\left(\frac{1}{2}\right)^2-1\right)^2} = \frac{-}{+} = -$$

$$f'(2) = \frac{-4(2)}{((2)^2-1)^2} = \frac{-}{+} = -$$

sign of $f'(x)$ $\frac{+}{-1} \mid \frac{+}{0} \mid \frac{-}{1} \mid \frac{-}{}$

$f(x)$ is increasing for $x < -1$ or $-1 < x < 0$.

$f(x)$ is decreasing for $0 < x < 1$ or $1 < x$.

Relative maximum at $x = 0$, $y = 0$.

5. Sign of $f''(x)$: Find where $f''(x) = 0$ or is undefined.

$$\begin{aligned} f''(x) &= - \left[\frac{(x^2-1)^2(4) - 4x(2)(x^2-1)(2x)}{(x^2-1)^4} \right] = - \left[\frac{(x^2-1)((x^2-1)(4) - 16x^2)}{(x^2-1)^4} \right] \\ &= - \left[\frac{-12x^2-4}{(x^2-1)^3} \right] = \frac{12x^2+4}{(x^2-1)^3}. \end{aligned}$$

$f''(x) \neq 0$, since the numerator is always positive.

$f''(x)$ is undefined for $x = \pm 1$.

So we need to check the sign of $f''(x)$ on the intervals:

$$x < -1, \quad -1 < x < 1, \quad 1 < x.$$

$$f''(-2) = \frac{12(-2)^2+4}{((-2)^2-1)^3} = \frac{+}{+} = +$$

$$f''(0) = \frac{12(0)^2+4}{((0)^2-1)^3} = \frac{+}{-} = -$$

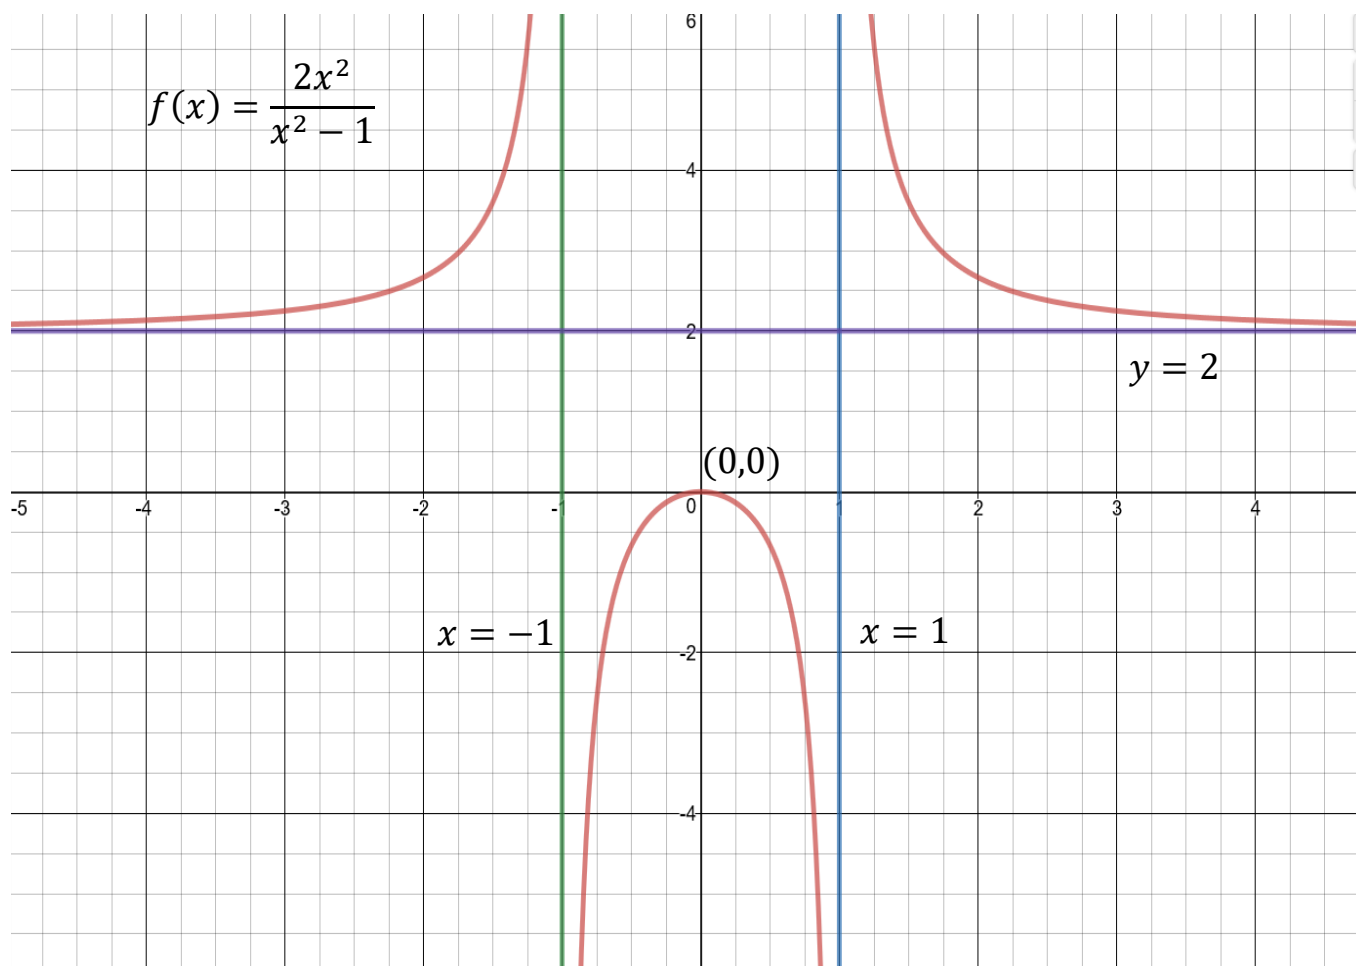

$$f''(2) = \frac{12(2)^2+4}{((2)^2-1)^3} = \frac{+}{+} = +$$

sign of $f''(x)$ $\frac{+}{-1}$ $\frac{-}{1}$ $\frac{+}{}$

$f(x)$ is concave up when $x < -1$ or $1 < x$.

$f(x)$ is concave down when $-1 < x < 1$.

There are no inflection points because $x = \pm 1$ are not points of continuity.

Ex. Sketch a graph of $f(x) = \frac{x^2 - 9}{(x-1)^2}$ given that $f'(x) = \frac{2(9-x)}{(x-1)^3}$ and $f''(x) = \frac{4(x-13)}{(x-1)^4}$. Include all of the information required in the previous example.

1. Domain: All real numbers except $x = 1$.

2. Intercepts: $x = 0 \Rightarrow f(0) = \frac{(0)^2 - 9}{(0-1)^2} = -9$, y-intercept is $(0, -9)$.

$$y = 0 \Rightarrow \frac{x^2 - 9}{(x-1)^2} = 0 \Rightarrow x = \pm 3, \text{ x-intercepts are } (\pm 3, 0).$$

3. Asymptotes: Vertical asymptotes- $f(x) = \frac{x^2-9}{(x-1)^2}; \quad x = 1.$

Horizontal asymptotes-

$$\lim_{x \rightarrow \pm\infty} \frac{x^2-9}{(x-1)^2} = \lim_{x \rightarrow \pm\infty} \frac{x^2(1-\frac{9}{x^2})}{x^2(1-\frac{1}{x})^2} = 1 \quad \Rightarrow \quad y = 1.$$

4. Sign of $f'(x)$: Find where $f'(x)$ is 0 or undefined.

$$f'(x) = \frac{2(9-x)}{(x-1)^3} = 0 \quad \Rightarrow \quad x = 9.$$

$f'(x)$ is undefined at $x = 1.$

Test the sign of $f'(x)$ on the intervals: $x < 1, \quad 1 < x < 9, \quad 9 < x.$

$$f'(0) = \frac{2(9-0)}{(0-1)^3} = \frac{+}{-} = -$$

$$f'(2) = \frac{2(9-2)}{(2-1)^3} = \frac{+}{+} = +$$

$$f'(10) = \frac{2(9-10)}{(10-1)^3} = \frac{-}{+} = -$$

sign of $f'(x)$ $\underline{\hspace{1cm} - \hspace{1cm} | \hspace{1cm} + \hspace{1cm} | \hspace{1cm} - \hspace{1cm}}$
1 9

$f(x)$ is increasing for $1 < x < 9$

$f(x)$ is decreasing for $x < -1$ or $9 < x.$

Relative maximum at $x = 9, \quad y = \frac{(9)^2-9}{(9-1)^2} = \frac{72}{64} = \frac{9}{8}.$

Note: $x = 1$ is not a relative minimum because $x = 1$ is not a point of continuity.

5. Sign of $f''(x)$: Find where $f''(x) = 0$ or is undefined.

$$f''(x) = \frac{4(x-13)}{(x-1)^4} = 0 \implies x = 13.$$

$f''(x)$ is undefined for $x = 1$.

So we need to check the sign of $f''(x)$ on the intervals:

$$x < 1, \quad 1 < x < 13, \quad 13 < x.$$

$$f''(0) = \frac{4(0-13)}{(0-1)^4} = \frac{-}{+} = -$$

$$f''(2) = \frac{4(2-13)}{(2-1)^4} = \frac{-}{+} = -$$

$$f''(14) = \frac{4(14-13)}{(14-1)^4} = \frac{+}{+} = +$$

sign of $f''(x)$ $\underline{\hspace{1cm} - \hspace{1cm} | \hspace{1cm} - \hspace{1cm} | \hspace{1cm} + \hspace{1cm}}$
1 13

$f(x)$ is concave up when $13 < x$.

$f(x)$ is concave down when $x < 1$ or $1 < x < 13$.

There's an inflection point at $x = 13$, $y = \frac{(13)^2 - 9}{(13-1)^2} = \frac{160}{144} = \frac{13}{12}$.

$x = 1$ is not an inflection point because $x = 1$ is not a point of continuity and $f''(x)$ doesn't change sign.
