

## Integrating Differential Forms over Subsets of $\mathbb{R}^3$

We will focus on three types of subsets of  $\mathbb{R}^3$ :

1. Oriented simple curves and oriented simple closed curves
2. Oriented surfaces
3. Elementary subregions.

### Integrals of 1-Forms over Curves

Let  $\omega$  be a 1-form on  $K \subseteq \mathbb{R}^3$ , and let  $c$  be any oriented simple curve. From our study of line integrals, we are already familiar with integrating a 1-form  $\omega = Pdx + Qdy + Rdz$  along a curve.

Ex. Let  $\omega = xy^2dx + z^3dy + dz$  be a 1-form on  $\mathbb{R}^3$ , and let  $c$  be the oriented simple curve:  $\vec{c}(t) = \langle 1, t^3, t \rangle$   $0 \leq t \leq 1$ . Find  $\int_c \omega$ .

$$\int_c \omega = \int_c xy^2dx + z^3dy + dz.$$

$$\vec{c}'(t) = \langle 0, 3t^2, 1 \rangle ;$$

$$\text{so } dx = 0dt, \quad dy = 3t^2dt, \quad dz = 1dt.$$

$$\begin{aligned} \int_c xy^2dx + z^3dy + dz &= \int_{t=0}^{t=1} (1)(t^3)^2(0)dt + t^3(3t^2)dt + 1dt \\ &= \int_0^1 (3t^5 + 1) dt = \frac{3}{2}. \end{aligned}$$

## Integrals of 2-Forms over Surfaces

Let  $\vec{\Phi}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$ ; where  $\vec{\Phi} : D \subset \mathbb{R}^2 \rightarrow \mathbb{R}^3$  is a parametrization of a smooth oriented surface  $S \subseteq \mathbb{R}^3$  and

$\eta = F(x, y, z)dx dy + G(x, y, z)dy dz + H(x, y, z)dz dx$  a 2-form on  $K \subseteq \mathbb{R}^3$ , where  $S \subseteq K \subseteq \mathbb{R}^3$ .

How do we evaluate  $\iint_S \eta$ ?

Definition: If  $S$  is an oriented surface such that  $S \subseteq K$ , an open set in  $\mathbb{R}^3$ , we define  $\iint_S \eta$  by the formula:

$$\begin{aligned} \iint_S \eta &= \iint_S F dx dy + G dy dz + H dz dx \\ &= \iint_D [F(\vec{\Phi}(u, v)) \frac{\partial(x,y)}{\partial(u,v)} + G(\vec{\Phi}(u, v)) \frac{\partial(y,z)}{\partial(u,v)} + H(\vec{\Phi}(u, v)) \frac{\partial(z,x)}{\partial(u,v)}] du dv \end{aligned}$$

$$\text{where: } \frac{\partial(x,y)}{\partial(u,v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix}, \quad \frac{\partial(y,z)}{\partial(u,v)} = \begin{vmatrix} \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} \end{vmatrix}, \quad \frac{\partial(z,x)}{\partial(u,v)} = \begin{vmatrix} \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} \\ \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \end{vmatrix}.$$

Let's see where this definition comes from. Recall that for surface integrals of vector fields we had:

$$\iint_S \vec{F} \cdot d\vec{S} = \iint_D \vec{F}(\vec{\Phi}(u, v)) \cdot (\vec{T}_u \times \vec{T}_v) du dv$$

where  $\vec{\Phi} : D \subseteq \mathbb{R}^2 \rightarrow \mathbb{R}^3$ ; and  $\vec{\Phi}(D) = S$ .

$$\vec{\Phi}(u, v) = \langle x(u, v), y(u, v), z(u, v) \rangle$$

$$\vec{T}_u = \frac{\partial \vec{\Phi}}{\partial u} = \left\langle \frac{\partial x}{\partial u}, \frac{\partial y}{\partial u}, \frac{\partial z}{\partial u} \right\rangle, \quad \vec{T}_v = \frac{\partial \vec{\Phi}}{\partial v} = \left\langle \frac{\partial x}{\partial v}, \frac{\partial y}{\partial v}, \frac{\partial z}{\partial v} \right\rangle, \text{ so we have:}$$

$$\begin{aligned} \vec{T}_u \times \vec{T}_v &= \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ \frac{\partial x}{\partial u} & \frac{\partial y}{\partial u} & \frac{\partial z}{\partial u} \\ \frac{\partial x}{\partial v} & \frac{\partial y}{\partial v} & \frac{\partial z}{\partial v} \end{vmatrix} \\ &= \begin{vmatrix} \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} \end{vmatrix} \vec{i} + \begin{vmatrix} \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} \\ \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \end{vmatrix} \vec{j} + \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} \vec{k} \\ &= \frac{\partial(y,z)}{\partial(u,v)} \vec{i} + \frac{\partial(z,x)}{\partial(u,v)} \vec{j} + \frac{\partial(x,y)}{\partial(u,v)} \vec{k}. \end{aligned}$$

We also know that:

$$d\vec{S} = (\vec{T}_u \times \vec{T}_v) du dv = \left\langle \frac{\partial(y,z)}{\partial(u,v)}, \frac{\partial(z,x)}{\partial(u,v)}, \frac{\partial(x,y)}{\partial(u,v)} \right\rangle du dv.$$

$$x = x(u, v), \quad y = y(u, v) \quad \text{so}$$

$$dx = \frac{\partial x}{\partial u} du + \frac{\partial x}{\partial v} dv$$

$$dy = \frac{\partial y}{\partial u} du + \frac{\partial y}{\partial v} dv \quad \text{and}$$

$$\begin{aligned} dx dy &= \left( \frac{\partial x}{\partial u} du + \frac{\partial x}{\partial v} dv \right) \wedge \left( \frac{\partial y}{\partial u} du + \frac{\partial y}{\partial v} dv \right) \\ &= \left[ \left( \frac{\partial x}{\partial u} \right) \left( \frac{\partial y}{\partial v} \right) - \left( \frac{\partial x}{\partial v} \right) \left( \frac{\partial y}{\partial u} \right) \right] du dv = \frac{\partial(x,y)}{\partial(u,v)} du dv. \end{aligned}$$

Similarly:

$$dydz = \frac{\partial(y,z)}{\partial(u,v)} dudv$$

$$dzdx = \frac{\partial(z,x)}{\partial(u,v)} dudv .$$

Thus we can write  $d\vec{S}$  as:

$$d\vec{S} = \left\langle \frac{\partial(y,z)}{\partial(u,v)}, \frac{\partial(z,x)}{\partial(u,v)}, \frac{\partial(x,y)}{\partial(u,v)} \right\rangle dudv = \langle dydz, dzdx, dxdy \rangle .$$

This means that we can write:

$$Fdx dy + Gdy dz + Hdz dx = \langle G, H, F \rangle \cdot \langle dydz, dzdx, dxdy \rangle .$$

In other words we can think of a vector field

$$\vec{E}(x, y, z) = \langle G(x, y, z), H(x, y, z), F(x, y, z) \rangle \text{ and write:}$$

$$\iint_S Fdx dy + Gdy dz + Hdz dx = \iint_S \vec{E} \cdot d\vec{S} .$$

Ex. Let  $\eta = (x^2 + y^2)dxdy$  be a 2-form on  $\mathbb{R}^3$ , and  $S$  be the portion of the cone:

$$\vec{\Phi}(r, \theta) = \langle r\cos\theta, r\sin\theta, r \rangle, \quad 0 \leq r \leq 1, \quad 0 \leq \theta \leq 2\pi, \quad \text{find } \iint_S \eta.$$

$$\iint_S \eta = \iint_S (x^2 + y^2)dxdy =$$

$$\iint_S F(x, y, z)dxdy = \iint_S F(\vec{\Phi}(r, \theta)) \frac{\partial(x, y)}{\partial(r, \theta)} drd\theta$$

where  $F(x, y, z) = x^2 + y^2$  and  $\frac{\partial(x, y)}{\partial(r, \theta)} = \left( \frac{\partial x}{\partial r} \frac{\partial y}{\partial \theta} - \frac{\partial x}{\partial \theta} \frac{\partial y}{\partial r} \right)$ .

$$\frac{\partial x}{\partial r} = \cos\theta \quad \frac{\partial y}{\partial \theta} = r\cos\theta \quad \frac{\partial x}{\partial \theta} = -r\sin\theta \quad \frac{\partial y}{\partial r} = \sin\theta$$

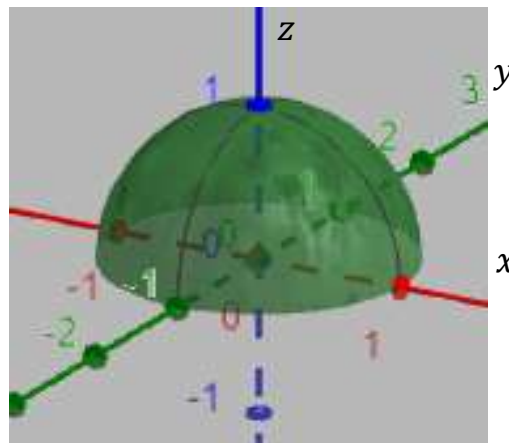

$$\frac{\partial(x, y)}{\partial(r, \theta)} = \left( \frac{\partial x}{\partial r} \frac{\partial y}{\partial \theta} - \frac{\partial x}{\partial \theta} \frac{\partial y}{\partial r} \right) = r, \quad F(\vec{\Phi}(r, \theta)) = r^2.$$

$$\iint_S (x^2 + y^2)dxdy = \int_{\theta=0}^{\theta=2\pi} \int_{r=0}^{r=1} (r^2)rdrd\theta = \int_{\theta=0}^{\theta=2\pi} \int_{r=0}^{r=1} r^3drd\theta = \frac{\pi}{2}.$$

Ex. Evaluate  $\iint_S (z^2 dx dy + y dy dz)$ , where  $S$  is the upper unit hemisphere in  $\mathbb{R}^3$ .

$$\vec{\Phi}(u, v) = \langle \cos v \sin u, \sin v \sin u, \cos u \rangle,$$

$$0 \leq u \leq \frac{\pi}{2}, \quad 0 \leq v \leq 2\pi.$$

$$\iint_S (z^2 dx dy + y dy dz) =$$

$$\int_{v=0}^{v=2\pi} \int_{u=0}^{u=\frac{\pi}{2}} \left[ (\cos^2 u) \frac{\partial(x,y)}{\partial(u,v)} + (\sin v \sin u) \frac{\partial(y,z)}{\partial(u,v)} \right] du dv.$$

$$\frac{\partial(x,y)}{\partial(u,v)} = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} \cos v \cos u & -\sin v \sin u \\ \sin v \cos u & \cos v \sin u \end{vmatrix} = (\cos u) \sin u$$

$$\frac{\partial(y,z)}{\partial(u,v)} = \begin{vmatrix} \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} \end{vmatrix} = \begin{vmatrix} \sin v \cos u & \cos v \sin u \\ -\sin u & 0 \end{vmatrix} = (\sin^2 u) \cos v.$$

$$\iint_S (z^2 dx dy + (y) dy dz)$$

$$= \int_{v=0}^{v=2\pi} \int_{u=0}^{u=\frac{\pi}{2}} [(\cos^2 u)(\cos u) \sin u + (\sin v)(\sin u)(\sin^2 u) \cos u] du dv$$

$$= \int_{v=0}^{v=2\pi} \int_{u=0}^{u=\frac{\pi}{2}} [(\cos^3 u) \sin u + (\sin^3 u)(\cos u)(\sin v)] du dv$$

$$= \int_{v=0}^{2\pi} \int_{u=0}^{\frac{\pi}{2}} [(\cos^3 u) \sin u] du dv + \int_{v=0}^{2\pi} \int_{u=0}^{\frac{\pi}{2}} [(\sin^3 u)(\cos u) \sin v] du dv.$$

To evaluate the first integral let  $w = \cos u$ ,  $-dw = (\sin u) du$ .

Notice that the second integral equals 0 because  $\int_{v=0}^{2\pi} (\sin v) dv = 0$ .

$$= - \int_{v=0}^{2\pi} \int_{w=1}^{w=0} w^3 dw = - \int_{v=0}^{2\pi} \frac{1}{4} w^4 \Big|_1^0 dv = \int_0^{2\pi} \frac{1}{4} dv = \frac{\pi}{2}.$$

### Integrals of 3-Forms over solids in $\mathbb{R}^3$

We have already seen how to integrate a 3-form  $\omega = f(x, y, z) dx dy dz$  over a region in  $\mathbb{R}^3$ .

Ex. Suppose  $\omega = (xy + z) dx dy dz$  and  $W = [0, 3] \times [1, 3] \times [0, 2]$ , a rectangular solid in  $\mathbb{R}^3$ . Evaluate  $\iiint_W \omega$ .

$$\iiint_W \omega = \int_{z=0}^{z=2} \int_{y=1}^{y=3} \int_{x=0}^{x=3} (xy + z) dx dy dz$$

$$= \int_{z=0}^{z=2} \int_{y=1}^{y=3} \frac{x^2 y}{2} + xz \Big|_0^3 dy dz$$

$$= \int_{z=0}^{z=2} \int_{y=1}^{y=3} \left( \frac{9y}{2} + 3z \right) dy dz$$

$$= \int_{z=0}^{z=2} \left( \frac{9y^2}{4} + 3yz \right) \Big|_1^3 dz$$

$$= \int_{z=0}^{z=2} \left( \frac{27}{4} + 9z \right) - \left( \frac{9}{4} + 3z \right) dz$$

$$= \int_{z=0}^{z=2} \left( \frac{9}{2} + 6z \right) dz = \frac{9}{2} z + 3z^2 \Big|_0^2 = 21.$$
